

Chosen Company Cards

An AI workflow case study for building connection, conversation and culture

Prototype product mockup generated during the workflow.

Purpose: show how a practical AI-assisted workflow can turn a loose idea into a usable, printable tool for family events, workplace learning, culture-building, and change-management support.

Status: working prototype. It is not final commercial artwork. It is close enough to print, test, refine and share as a holiday gift or internal learning tool.

Executive summary

This case study documents the creation of Chosen Company Cards, a family-friendly conversation card game designed for the part of the evening after the meal, before everyone leaves, when people are relaxed enough to laugh, debate and say something real.

The project started as a simple idea: create conversation starters that extended family could use without embarrassing anyone, shaming anyone, or forcing personal disclosure. The design then shifted toward fun, teen-friendly choices: pick one, would you rather, pick two of five, rank them, build your kit, build your team, one rule and superpower-with-a-catch cards.

The result is a 100-card printable deck with front and back artwork, category iconography, brand naming, product mockups, an in-use image, and A4 print files for cards and box artwork. The files are not perfect, but AI completed the heavy lifting. The remaining work is human judgement: print testing, proofreading, trimming, playtesting and final polish.

The wider lesson is bigger than the family game. The same workflow can gamify almost any area where people need to engage with ideas, make choices, practise judgment, and build shared language. That includes onboarding, safety conversations, values work, change readiness, role clarity, process improvement, personal growth, team rituals and upcoming company change-management work.

Core thesis

AI can turn an idea into a practical learning artefact quickly when the human owns the intent, safety rules, tone, context and final judgement.

The value was not just content generation. The value was the workflow: idea shaping, risk framing, question design, format design, naming, visual identity, product mockup, print layout and case-study synthesis in one connected chain.

Traditional assumption	AI-assisted alternative
Learning tools require a formal project before anything usable exists.	A rough but usable prototype can be generated first, then improved through testing.
Design, copy, instruction writing and layout must happen as separate tasks.	The same concept can be developed across copy, visuals, files and implementation in one workflow.
Gamification risks becoming gimmicky.	Gamification works when the mechanics support safe choice, discussion, reflection and practice.
Connection and culture tools need to be serious to be meaningful.	Playful tools can create safe access to meaningful conversation when the framing is careful.

The product created

Chosen Company Cards is a conversation card game for families, friends and groups who want low-pressure conversation with enough structure to include teenagers and adults.

Generated in-use image showing the intended context: relaxed, after-dinner, lounge-based group conversation.

Component	What was created
Question bank	100 cards across safe, playful categories.
Game mechanics	Pick one, would you rather, pick two of five, rank them, build your kit, build your team, one rule and power-with-a-catch.
Safety design	Pass option, kind teasing, no personal shaming, no forced vulnerability, no ranking family members negatively.
Brand	Chosen Company Cards, with tagline and short product copy.
Visual system	Minimal black-and-white icon language for card categories.
Print system	A4 printable card fronts, mirrored backs for duplex-style manual printing, and box artwork.
Mockups	Product mockup and lifestyle image for instructions, landing page or gifting notes.

Safety and inclusion design

The first design decision was not visual. It was social safety. A family tool has to work across ages, temperaments and histories. The prompt system avoided questions that could trigger conflict, shame, comparison or disclosure pressure.

Avoided	Used instead
Family conflict, regrets, money, health, body, relationships and secrets.	Hypothetical choices, impossible trade-offs, superpowers, survival kits and light values.
Who is best, worst, favourite or most annoying.	What would you choose and why.
Confession-style questions.	Game-style questions with optional depth.
Embarrassing stories about someone else.	Personal reasoning, silly disagreement and safe follow-up questions.

This matters for workplace use too. A culture-building or change-management tool should not corner people. It should let people participate safely, reveal useful thinking, and build shared language without forcing exposure.

Workflow capture

Workflow capture: the repeatable AI-assisted process used to move from loose idea to printable artefact.

The workflow did not rely on one perfect prompt. It used progressive shaping. Each step created a more useful input for the next step. This is the important pattern for workplace use: AI becomes more useful when the work is structured as a chain of decisions, not a single request.

Workflow step	Human role	AI role
Intent	Define the real purpose and audience.	Offer framing and possible directions.
Safety frame	Decide what must be avoided.	Convert risks into practical rules and question constraints.
Mechanics	Choose the tone and play style.	Generate game formats and examples.
Content bank	Approve direction and refine categories.	Produce structured card copy at scale.
Brand and visuals	Select what feels right.	Generate naming options, icon concepts and mockups.
Production files	Define print requirements.	Generate A4 printable PDFs and box artwork.
Case study	Connect the project to wider value.	Synthesize the workflow, outputs and transferability.

Early icon-grid generation. Useful for direction, then refined toward a simpler black-and-white card system.

Fronts 1/12

A4 printable fronts: icons identify category before the question is revealed.

Pick One

Pick one life upgrade: never lose anything, always sleep well, never get sick, always know what to say, or always have enough time.

Why that one? Would it change your daily life or just make it easier?

Chosen Company Cards · Card 003

Pick One

Pick one animal sidekick: dog, horse, hawk, dolphin, monkey, or tiny dragon.

Why that one? What job would it have in your life?

Chosen Company Cards · Card 002

Pick One

Pick one superpower for everyday life: flying, invisibility, teleporting, healing, or talking to animals.

Why that one? What would you use it for first?

Chosen Company Cards · Card 001

Pick One

Pick one skill to instantly master: cooking, driving anything, singing, building, public speaking, or fixing engines.

Why that skill? What would you do with it first?

Chosen Company Cards · Card 006

Pick One

Pick one magical kitchen power: dinner appears, dishes vanish, the pantry restocks itself, food never burns, or everyone likes the same meal.

Why that one? What meal would you test it on first?

Chosen Company Cards · Card 005

Pick One

Pick one room to add to your house: library, gaming room, workshop, indoor pool, movie room, or secret room.

Why that room? Who would use it most?

Chosen Company Cards · Card 004

Pick One

Pick one tiny pet: mini cow, mini horse, tiny dragon, talking chicken, pocket-sized dog, or fluffy robot.

Why that one? What would you name it?

Chosen Company Cards · Card 009

Pick One

Pick one weather power: stop rain, call rain, stop wind, make snow, make sunshine, or predict weather perfectly.

Why that one? Would you use it for yourself or for everyone?

Chosen Company Cards · Card 008

Pick One

Pick one thing to make free forever: groceries, fuel, power, travel, clothes, or books.

Why that one? Would your answer change in ten years?

Chosen Company Cards · Card 007

Backs 1/12 · mirrored for long-edge flip

A4 printable backs: question and follow-up text, mirrored for long-edge flip printing.

Print at 100% on A4. Cut outer solid lines, score fold lines, fold, and glue the dashed flap.

A4 box artwork prototype. This is a proof-of-concept dieline and needs physical test fitting before final use.

How this transfers to workplace tools

The same method can produce practical workplace tools. The key is to replace family-safe questions with work-safe prompts that support learning, reflection, decision-making and alignment.

Use case	Possible card mechanics	Example prompt style
----------	-------------------------	----------------------

Chosen Company Cards | AI workflow case study

Change readiness	Pick one, rank them, build your kit.	Pick the support you would need first: clear timeline, training, manager check-in, peer buddy or written guide. Why?
Process improvement	Would you rather, rank them, one rule.	Rank these blockers from most painful to least painful: unclear handoffs, rework, missing data, slow approvals, tool confusion.
Onboarding	Build your kit, pick two of five.	Pick two things every new person should understand in week one. Why those two?
Values and culture	Pick one, would you rather.	Would you rather be known as dependable, curious, practical, fair or brave? Why?
Leadership development	Power with a catch, rank them.	You can make decisions faster, but you must explain the trade-off clearly. Take the power or leave it?
Safety conversations	Scenario cards, build your team.	You see a small risk before it becomes a problem. Who needs to know, and what do you say first?
Personal growth	Pick two, future guarantee.	Pick two resources you want more of this month: time, energy, focus, confidence or support. Why?

Change-management relevance

For upcoming company change work, this approach is useful because it creates a safe practice space. People can explore choices before they have to act. They can reveal concerns through low-pressure prompts. Leaders can hear patterns without turning every conversation into a formal survey.

A change-management card set could be built around the same logic: practical scenarios, trade-offs, support needs, likely blockers, role clarity, customer impact, data confidence, handover quality and what good adoption looks like in daily work.

Change question	Why it helps
Pick the change support that would help you most this week.	Surfaces practical support needs without asking people to confess resistance.
Rank these risks: unclear process, not enough training, tool confusion, time pressure, mixed messages.	Turns vague anxiety into specific improvement signals.
Build your adoption kit: choose three supports you would want before go-live.	Creates a usable readiness checklist.
Would you rather have a perfect process map or a fast peer-support channel?	Reveals how people actually learn and work.
You can fix one handoff in the process. Which one?	Directs attention to operational friction.

Time analysis

The figures below are estimates for the prototype stage only. They are not stopwatch measurements. They compare what was achieved in this AI-assisted workflow with a light traditional approach using separate writing, design, layout and production steps.

Estimated active-time comparison. AI did most of the build work, while human judgement guided intent, safety, tone and decisions.

Stage	AI-assisted estimate	Traditional light-prototype estimate
Brief and safety frame	15 minutes	1 to 2 hours
Question design and 100-card copy	45 minutes	6 to 10 hours
Information architecture and categories	15 minutes	1 to 3 hours
Naming, icons and design direction	20 minutes	2 to 4 hours
Mockup and use-case imagery	20 minutes	2 to 4 hours
Printable card and box file build	40 minutes	5 to 9 hours
QA and iteration	15 minutes	2 to 4 hours
Case-study synthesis	30 minutes	3 to 5 hours
Estimated total	About 3.3 active hours	About 22 to 41 active hours

The main time saving came from scale and integration. AI generated structured options, repeated layouts, image concepts and document assets faster than a person could produce them manually. The main human work remained decision-making: what is safe, what is useful, what feels right, what should be cut, and what needs testing.

What still needs human work

This is a realistic prototype, not a finished commercial product. Before printing multiple family gift sets or using a similar method at work, the following checks matter.

Check	Why it matters
Proofread every card.	Small wording issues become obvious once printed.
Print one test sheet front and back.	Printer handling can change alignment.
Test cardstock thickness.	Card feel affects use. Box fit depends on thickness.
Cut and playtest 10 to 20 cards.	The first real use will reveal which cards are too long, too flat or too similar.
Adjust the box dieline after physical testing.	The prototype box art is a starting point, not a guaranteed production dieline.
Check workplace prompts with leaders and participants.	Workplace tools need cultural safety, privacy awareness and alignment with the change goal.

Reusable playbook

This is the repeatable pattern for creating a similar tool.

Step	Instruction
1. Name the real social job	State what the tool must make easier: conversation, onboarding, reflection, role clarity, adoption, safety or shared

Chosen Company Cards | AI workflow case study

	learning.
2. Define the risks	List what the tool must avoid: shame, forced disclosure, ranking people, blame, jargon, politics, personal data or unsafe debate.
3. Choose the mechanics	Use game formats that fit the goal: pick one, rank them, build your kit, scenario cards, trade-offs, wildcard or team-role prompts.
4. Generate structured content	Create a repeatable schema with card number, type, category, prompt and follow-up.
5. Add visual language	Use icons or colour to show what type of thinking the card asks for.
6. Prototype the physical or digital artefact	Make it printable, shareable or usable in the place where the conversation will happen.
7. Test with real people	Watch what gets used, skipped, laughed at, argued with or misunderstood.
8. Refine and distribute	Keep what works. Remove what creates friction. Make the next version cleaner.

Conclusion

Chosen Company Cards started as a family holiday gift idea. It became a working example of AI-supported toolmaking: safe conversation design, playful structure, production assets and practical print files created in one workflow.

The project shows that AI can do far more than write copy. It can help move an idea through strategy, structure, content, brand, design, production and reflection. The result still needs human testing and polish, but it has done enough of the work to make the project real.

The bigger opportunity is to use this pattern deliberately: build small, safe, useful tools that help people talk, learn, choose, practise and adapt. That applies at the dinner table. It also applies inside organisations navigating change.

Appendix: artefacts produced in this workflow

Artefact	Purpose
family_conversation_cards.md	Structured source content for the card deck.
chosen_company_cards_printable_A4.pdf	Printable A4 card fronts and backs.
chosen_company_box_template_A4.pdf	A4 prototype box artwork.
minimalist_conversation_card_game_display.png	Product mockup for presentation and landing page use.
